We all got the same result on our own, due to having fairly simple procedural tasks

Estimate Time- 5 + 2t seconds

Actual Time- 2.8 seconds

Reflection-

Our reaction time was negligible, which lead to low actual time. We also have worked with the prototype extensively, so we were able to navigate through it faster than the average person. We had very similar results for the initial KLM, but I was missing one Response Time section. We updated our KLM to fix this then calculated time.
